Organizational Requirements

Environmental Requirements

- The system must be compatible with **modern web browsers** (Chrome, Firefox, Safari) to ensure accessibility for both individual travelers and business clients.
- The platform must support **secure integration** with external email servers to handle automated triggers for account confirmations and booking receipts.
- The deployment environment must utilize **HTTPS** to secure all data transmissions, protecting sensitive business credentials and traveler details.
- The infrastructure must be **mobile-responsive**, allowing travel agencies and users to manage packages and reservations from various hardware environments.

Operational Requirements

- A **verification workflow** must be strictly followed where an Admin reviews and approves business accounts before they are granted B2B access.
- The system must mandate the entry of a **company tax number** during business registration to comply with organizational auditing and B2B standards.
- Administrative actors must be provided with **monitoring tools** to track platform activity and generate reports on usage and booking trends.
- **Role-based permissions** must be enforced to ensure that travel agencies can only update or remove their own published packages.

Development Requirements

- All use case specifications must adhere to the **standardized tabular template** established in the project's documentation to maintain consistency.
- Implementation must follow the defined **User Story roadmap** (US_01 through US_27) to ensure all traveler and agency requirements are met.
- The development team must use **encrypted formats** for password storage to ensure security parity across all account modules.
- **Version control** (such as GitHub) should be used to manage all project documentation and code, ensuring a clear history of updates for each use case.
- The UI development must be guided by **pre-approved Figma designs** to ensure consistency between user stories and the final user interface.
